

## 8. QUADRILATERALS (NOTES)

PREPARED BY: BALABHADRA SURESH

1. A quadrilateral has four sides, four angles and four vertices.

Quadrilateral	Figure	Properties
<b>Trapezium</b> A quadrilateral with a pair of parallel sides.		1. One pair of parallel lines
<b>Parallelogram:</b> A quadrilateral with each pair of opposite sides parallel		1. Opposite sides are equal. 2. Opposite angles are equal. 3. Diagonals not equal and bisect one another. 4. Adjacent angles are supplementary
<b>Rhombus:</b> A parallelogram with sides of equal length.		1. All sides are equal. 2. Opposite angles are equal 3. Diagonals are not equal and perpendicularly bisect one another. 4. Adjacent angles are supplementary
<b>Rectangle:</b> A parallelogram with a right angle		1. Opposite sides are equal 2. All angles are right angles. 3. Diagonals are equal and bisect one another.
<b>Square:</b> A rectangle with sides of equal length.		1. All sides are equal. 2. All angles are right angles. 3. Diagonals are equal and perpendicularly bisect one another.
<b>Kite:</b> A quadrilateral with exactly two pairs of equal consecutive sides		1. The diagonals are perpendicular to one another. 2. Diagonals bisect each other.

**Theorem 8.1 :** A diagonal of a parallelogram divides it into two congruent triangles.

Proof : Let ABCD be a parallelogram and AC be a diagonal

In  $\Delta ABC$  and  $\Delta CDA$ ,

$BC \parallel AD$  and  $AC$  is a transversal.

$\angle BCA = \angle DAC$  (Pair of alternate angles)

$AB \parallel DC$  and  $AC$  is a transversal.

$\angle BAC = \angle DCA$  (Pair of alternate angles)

$AC = CA$  (Common)

$\Delta ABC \cong \Delta CDA$  (ASA rule)

Diagonal  $AC$  divides parallelogram  $ABCD$  into two congruent triangles  $ABC$  and  $CDA$ .

**Theorem 8.2 : In a parallelogram, opposite sides are equal.**

Proof: Let ABCD be a parallelogram and AC be a diagonal.

$\Delta ABC \cong \Delta CDA$  (ASA rule)

So,  $AB = DC$  and  $BC = AD$  (CPCT)

Theorem 8.3 : If each pair of opposite sides of a quadrilateral is equal, then it is a parallelogram.

Proof: ABCD be a quadrilateral and  $AB = DC$  and  $BC = AD$

In  $\Delta ABC$  and  $\Delta CDA$

$AB = DC$  (given)

$BC = AD$  (given)

$AC = AC$  (common)

$\Delta ABC \cong \Delta CDA$  (SSS congruence rule)

$\angle BAC = \angle DCA$  (CPCT)

Alternate interior angles are equal  $\Rightarrow AB \parallel CD$

Similarly  $BC \parallel DA$

Each pair of opposite sides are parallel .

ABCD is a parallelogram.

**Theorem 8.4 : In a parallelogram, opposite angles are equal.**

Proof: ABCD is a parallelogram.

$AB \parallel CD$  and  $AC$  is transversal

$x = p$  (Alternate interior angles)

$BC \parallel AD$  and  $AC$  is transversal

$y = q$  (Alternate interior angles)

$x + y = p + q$

$\angle BAD = \angle BCD \Rightarrow \angle A = \angle C$

Similarly  $\angle B = \angle D$

**Theorem 8.5 :** If in a quadrilateral, each pair of opposite angles is equal, then it is a parallelogram.

Proof: In quadrilateral ABCD,  $\angle A = \angle C$  and  $\angle B = \angle D$

$\angle A + \angle B + \angle C + \angle D = 360^\circ$  (Sum of angles in quadrilateral)

$\angle A + \angle D + \angle A + \angle D = 360^\circ$

$2(\angle A + \angle D) = 360^\circ$

$\angle A + \angle D = 180^\circ$

Co interior angles are supplementary

$\Rightarrow AB \parallel DC$

Similarly  $BC \parallel AD$

$\therefore$  ABCD is a parallelogram.

**Theorem 8.6 :** The diagonals of a parallelogram bisect each other.

Proof: In parallelogram ABCD diagonals AC, BD intersect at O

$\Delta AOD = \Delta COB$  (ASA rule)

$AO = CO$  and  $OD = OB$  (CPCT)

$\Rightarrow O$  is mid point of AC and BD

$\Rightarrow AC$  and  $BD$  are bisect each other

**Theorem 8.7 :** If the diagonals of a quadrilateral bisect each other, then it is a parallelogram

Proof: ABCD is a quadrilateral. The diagonals AC and BD bisect at O

In  $\Delta AOB$ ,  $\Delta COD$

$OA = OC$  and  $OB = OD$  (given)

$\angle AOB = \angle COD$  (vertically opposite angles)

$\triangle AOB \cong \triangle COD$  (SAS congruence rule)

$\therefore \angle ABO = \angle CDO$  (By CPCT)

Alternate interior angles are equal

$\therefore AB \parallel CD$

Similarly  $BC \parallel AD$

Therefore ABCD is a parallelogram.

**Example 1 : Show that each angle of a rectangle is a right angle.**

Sol: Rectangle is a parallelogram in which one angle is a right angle.

ABCD is a rectangle. Let one angle is  $\angle A = 90^\circ$

We have,  $AD \parallel BC$  and AB is a transversal.

$\angle A + \angle B = 180^\circ$  (Interior angles on the same side of the transversal)

$90^\circ + \angle B = 180^\circ$

$\angle B = 180^\circ - 90^\circ = 90^\circ$

$\angle C = \angle A$  and  $\angle D = \angle B$  (Opposite angles of the parallelogram)

$\angle C = 90^\circ$  and  $\angle D = 90^\circ$

Therefore, each of the angles of a rectangle is a right angle.

**Example 2 : Show that the diagonals of a rhombus are perpendicular to each other.**

Sol: Let ABCD is a rhombus.

$AB = BC = CD = DA$  (All sides are equal in rhombus)

In  $\triangle AOD$  and  $\triangle COD$

$OA = OC$  (Diagonals of a parallelogram bisect each other)

$OD = OD$  (Common)

$AD = CD$  (given)

$\triangle AOD \cong \triangle COD$  (SSS congruence rule)

$\angle AOD = \angle COD$  (CPCT)

But,  $\angle AOD + \angle COD = 180^\circ$  (Linear pair)

$2\angle AOD = 180^\circ$

$\angle AOD = 90^\circ$

So, the diagonals of a rhombus are perpendicular to each other.

**Example 3 :** ABC is an isosceles triangle in which  $AB = AC$ . AD bisects exterior angle PAC and  $CD \parallel AB$  (see Fig. 8.8). Show that (i)  $\angle DAC = \angle BCA$  and (ii) ABCD is a parallelogram.

Sol: (i)  $\Delta ABC$  is isosceles in which  $AB = AC$  (Given)

So,  $\angle ABC = \angle ACB$  (Angles opposite to equal sides)

Also,  $\angle PAC = \angle ABC + \angle ACB$  (Exterior angle of a triangle)

or,  $\angle PAC = 2\angle ACB \rightarrow (1)$

Now, AD bisects  $\angle PAC$ .

So,  $\angle PAC = 2\angle DAC \rightarrow (2)$

$2\angle DAC = 2\angle ACB$  [From (1) and (2)]

$\angle DAC = \angle BCA$

(ii)  $\angle DAC = \angle ACB$  i.e alternate interior angles are equal.

$\Rightarrow BC \parallel AD$

Also,  $BA \parallel CD$  (Given)

Now, both pairs of opposite sides of quadrilateral ABCD are parallel.

So, ABCD is a parallelogram.

**Example 4 :** Two parallel lines  $l$  and  $m$  are intersected by a transversal  $p$  (see Fig. 8.9). Show that the quadrilateral formed by the bisectors of interior angles is a rectangle.

Sol:  $PS \parallel QR$  and transversal  $p$  intersects them at points A and C .

The bisectors of  $\angle PAC$  and  $\angle ACQ$  intersect at B and bisectors of  $\angle ACR$  and  $\angle SAC$  intersect at D.

Now,  $\angle PAC = \angle ACR$  (Alternate angles as  $l \parallel m$  and  $p$  is a transversal)

$$\frac{1}{2} \angle PAC = \frac{1}{2} \angle ACR$$

i.e.,  $\angle BAC = \angle ACD \Rightarrow$  alternate interior angles are equal.

$AB \parallel DC$

Similarly,  $BC \parallel AD$  (Considering  $\angle ACB$  and  $\angle CAD$ )

Therefore, quadrilateral ABCD is a parallelogram.

$\angle PAC + \angle CAS = 180^\circ$  (Linear pair)

$$\frac{1}{2} \angle PAC + \frac{1}{2} \angle CAS = \frac{1}{2} \times 180^\circ = 90^\circ$$

$$\angle BAC + \angle CAD = 90^\circ$$

$$\angle BAD = 90^\circ$$

So, ABCD is a parallelogram in which one angle is  $90^\circ$ .

Therefore, ABCD is a rectangle.

**Example 5 : Show that the bisectors of angles of a parallelogram form a rectangle.**

Sol : Let P, Q, R and S be the points of intersection of the bisectors of

$\angle A$  and  $\angle B$ ,  $\angle B$  and  $\angle C$ ,  $\angle C$  and  $\angle D$ , and  $\angle D$  and  $\angle A$  of parallelogram ABCD. In  $\triangle ASD$ , DS bisects  $\angle D$  and AS bisects  $\angle A$

$$\therefore \angle DAS + \angle ADS = \frac{1}{2} \angle A + \frac{1}{2} \angle D = \frac{1}{2} (\angle A + \angle D)$$

$$= \frac{1}{2} \times 180^\circ \text{ (}\angle A \text{ and } \angle D \text{ are adjacent angles of parallelogram ABCD)}$$

$$= 90^\circ$$

Also,  $\angle DAS + \angle ADS + \angle DSA = 180^\circ$  (Angle sum property of a triangle)

$$90^\circ + \angle DSA = 180^\circ$$

$$\angle DSA = 90^\circ$$

$\angle PSR = 90^\circ$  (Being vertically opposite to  $\angle DSA$ )

Similarly  $\angle SPQ = 90^\circ$ ,  $\angle PQR = 90^\circ$  and  $\angle SRQ = 90^\circ$

So, PQRS is a quadrilateral in which all angles are right angles.

So, PQRS is a rectangle.

### EXERCISE 8.1

1. If the diagonals of a parallelogram are equal, then show that it is a rectangle.

Sol: ABCD is a parallelogram and diagonals  $AC=BD$

$$\triangle ABC \cong \triangle DCB \text{ (SSS congruence rule)}$$

$$\angle ABC = \angle DCB \text{ (CPCT)}$$

$$\angle ABC + \angle DCB = 180^\circ \text{ (co-interior angles are supplementary)}$$

$$\angle ABC + \angle ABC = 180^\circ$$

$$2\angle ABC = 180^\circ$$

$$\angle ABC = 90^\circ$$

ABCD is a parallelogram and one of the angles is  $90^\circ$

ABCD is a rectangle.

**2. How that the diagonals of a square are equal and bisect each other at right angles.**

Sol: Let ABCD is square.

$$\Delta ABC \cong \Delta DCB \text{ (SAS rule)}$$

$$AC = BD \text{ (By CPCT)} \Rightarrow \text{Diagonals are equal}$$

$$\Delta AOB \cong \Delta COD \text{ (ASA congruence rule)}$$

$$\therefore AO = CO \text{ and } OB = OD \text{ (by CPCT)}$$

$\Rightarrow$  Diagonals are bisect each other

$$\Delta AOB \cong \Delta COB \text{ (SSS congruence rule)}$$

$$\angle AOB = \angle COB \text{ (by CPCT)}$$

$$\text{But } \angle AOB + \angle COB = 180^\circ \text{ (Linear pair)}$$

$$\angle AOB + \angle AOB = 180^\circ$$

$$2\angle AOB = 180^\circ$$

$$\angle AOB = 90^\circ$$

Diagonals are bisect each other at right angles.

**3. Diagonal AC of a parallelogram ABCD bisects  $\angle A$  Show that (i) it bisects  $\angle C$  also, (ii) ABCD is a rhombus.**

Sol: (i)  $\angle BAC = \angle DAC$  (AC bisects  $\angle A$ )  $\rightarrow$  (1)

$$\angle BAC = \angle DCA \text{ (Alternate interior angles)} \rightarrow (2)$$

$$\angle DAC = \angle BCA \text{ (Alternate interior angles)} \rightarrow (3)$$

From (1), (2), (3)

$$\angle DCA = \angle BCA$$

Hence AC bisects  $\angle C$  also.

(ii) In  $\Delta BAC$

$$\angle BAC = \angle BCA \text{ (From (1), (2), (3))}$$

$$AB = BC \text{ (opposite sides of equal angles are equal)} \rightarrow (4)$$

$$\text{But } AB = DC \text{ and } BC = AD \text{ (Opposite sides of parallelogram)} \rightarrow (5)$$

From (4) ,(5)

$$AB = BC = CD = DA$$

Hence, ABCD is a rhombus.

4. ABCD is a rectangle in which diagonal AC bisects  $\angle A$  as well as  $\angle C$ . Show that: (i) ABCD is a square (ii) diagonal BD bisects  $\angle B$  as well as  $\angle D$ .

Sol: ABCD is a rectangle

Diagonal AC bisects  $\angle A$  as well as  $\angle C$

$$\angle BAC = \angle DAC = \frac{1}{2}\angle A \text{ and } \angle BCA = \angle DCA = \frac{1}{2}\angle C$$

$$\text{But } \angle A = \angle C \Rightarrow \frac{1}{2}\angle A = \frac{1}{2}\angle C$$

$$\Rightarrow \angle BAC = \angle BCA$$

$$\Rightarrow AB = BC \text{ (Sides opposite to equal angles are equal)}$$

But  $AB = DC$  and  $BC = DA$  (opposite sides of a rectangle are equal)

$$\therefore AB = BC = CD = DA$$

$\therefore$  ABCD is a square.

(ii) In  $\triangle BCD$ ,  $BC = CD$  (ABCD is a square)

$$\angle CBD = \angle CDB \text{ (Angles opposite to equal sides are equal)}$$

But  $\angle CBD = \angle ADB$  and  $\angle CDB = \angle ABD$  (alternate interior angles)

$$\therefore \angle CBD = \angle ABD \text{ and } \angle CDB = \angle ADB$$

BD bisects  $\angle D$  and  $\angle B$ .

5. In parallelogram ABCD, two points P and Q are taken on diagonal BD such that  $DP = BQ$  (see Fig. 8.12). Show that:

(i)  $\triangle APD \cong \triangle CQB$  (ii)  $AP = CQ$  (iii)  $\triangle AQB \cong \triangle CPD$  (iv)  $AQ = CP$  (v) APCQ is a parallelogram.

Sol: (i) In  $\triangle APD$  and  $\triangle CQB$

$$\angle ADP = \angle CBQ \text{ (Alternate interior angles)}$$

$$AD = BC \text{ (Opposite sides of a parallelogram are equal)}$$

$$DP = BQ \text{ (Given)}$$

$$\triangle APD \cong \triangle CQB \text{ (SAS congruence rule)}$$

$$\text{(ii) } \triangle APD \cong \triangle CQB \text{ (From (i))}$$

$$\therefore AP=CQ \text{ (CPCT)}$$

(iii) In  $\triangle AQB$  and  $\triangle CPD$

$$\angle ABQ = \angle CDP \text{ (Alternate interior angles)}$$

$$AB=CD \text{ (Opposites of a parallelogram are equal)}$$

$$BQ=DP \text{ (Given)}$$

$$\triangle AQB \cong \triangle CPD \text{ (SAS congruence rule)}$$

(iv)  $\triangle AQB \cong \triangle CPD$  (From (iii))

$$\therefore AQ=CP \text{ (CPCT)}$$

(v) In quadrilateral  $APCQ$

$$AP=CQ \text{ and } AQ=CP$$

Hence  $APCQ$  is a parallelogram.

6.  $ABCD$  is a parallelogram and  $AP$  and  $CQ$  are perpendiculars from vertices  $A$  and  $C$  on diagonal  $BD$  (see Fig. 8.13). Show that (i)  $\triangle APB \cong \triangle CQD$  (ii)  $AP = CQ$

Sol: (i) In  $\triangle APB$  and  $\triangle CQD$

$$\angle APB = \angle CQD = 90^\circ$$

$$AB=CD \text{ (opposite sides of parallelogram are equal)}$$

$$\angle ABD = \angle CDQ \text{ (} AB \parallel CD \text{, alternate interior angles)}$$

$$\therefore \triangle APB \cong \triangle CQD \text{ (AAS congruence rule)}$$

(ii)  $\triangle APB \cong \triangle CQD$  (from (i))

$$\therefore AP=CQ \text{ (CPCT)}$$

7.  $ABCD$  is a trapezium in which  $AB \parallel CD$  and  $AD = BC$  (see Fig. 8.14). Show that (i)  $\angle A = \angle B$  (ii)  $\angle C = \angle D$  (iii)  $\triangle ABC \cong \triangle BAD$  (iv) diagonal  $AC =$  diagonal  $BD$

[Hint: Extend  $AB$  and draw a line through  $C$  parallel to  $DA$  intersecting  $AB$  produced at  $E$ .]

Sol: Draw  $AE \parallel DC$  and  $CE \parallel DA$

$ADCE$  is a parallelogram

$$AD=CE \text{ (opposite sides of } ADCE \text{)}$$

$$AD = BC \text{ (given)}$$

$$\therefore BC=CE$$

$$\angle CEB = \angle CBE \text{ (equal sides opposite angles are equal)}$$

$\angle A + \angle CEB = 180^\circ$  (co-interior angles are supplementary)

$\angle A + \angle CBE = 180^\circ$  ( $\angle CEB = \angle CBE$ )  $\rightarrow$  (1)

$\angle B + \angle CBE = 180^\circ$  (Linear pair)  $\rightarrow$  (2)

From (1) and (2)

$\angle A = \angle B$

(ii)  $\angle A + \angle D = 180^\circ$  (co-interior angles)  $\rightarrow$  (3)

$\angle B + \angle C = 180^\circ$  (co-interior angles)  $\rightarrow$  (4)

From (3) and (4)

$\angle B + \angle C = \angle A + \angle D$

But  $\angle A = \angle B$

$\therefore \angle C = \angle D$

(iii) In  $\triangle ABC$  and  $\triangle BAD$ ,

$BC = AD$  (given)

$AB = BA$  (common side)

$\angle B = \angle A$  (From (i))

$\triangle ABC \cong \triangle BAD$  (SAS congruence rule)

(iv)  $\triangle ABC \cong \triangle BAD$  (from (iii))

$\therefore AC = BD$  (by CPCT)

### The Mid-point Theorem

**Theorem 8.8 :** The line segment joining the mid-points of two sides of a triangle is parallel to the third side.

**Proof:** In  $\triangle ABC$ , E and F are mid-points of AB and AC respectively and draw  $CD \parallel BA$ .

In  $\triangle AEF$ ,  $\triangle CDF$

$\angle AEF = \angle CDF$  (Alternate interior angles)

$\angle EAF = \angle FCD$  (Alternate interior angles)

$AF = FC$  (F is mid point of AC)

$\triangle AEF \cong \triangle CDF$  (ASA rule)

$EF = DF$  and  $BE = AE = DC$  (CPCT)

$\therefore$  BCDE is a parallelogram. So,  $EF \parallel BC$

**Theorem 8.9 :** The line drawn through the mid-point of one side of a triangle, parallel to another side bisects the third side.

Proof: In  $\triangle ABC$ , E is midpoint of AB.

Draw a line  $l$  passing through E and parallel to  $BC$ . The line intersects AC at F.

Construct  $CD \parallel BA$

$EB \parallel DC$  and  $ED \parallel BC$

$\Rightarrow$  EBCD is a parallelogram.

$BE = DC$  (opposite sides of parallelogram)

But  $BE = AE$  (E is midpoint of AB)

$\therefore AE = CD \rightarrow (1)$

In  $\triangle AFE$  and  $\triangle CFD$

$\angle EAF = \angle DCF$  ( $BA \parallel CD$  and  $AC$  is transversal, alternate interior angles)

$\angle AEF = \angle CDF$  ( $BA \parallel CD$  and  $ED$  is transversal, alternate interior angles)

$AE = CD$  (from (1))

$\triangle AFE \cong \triangle CFD$  (ASA congruence rule)

$\therefore AF = CF$  (CPCT)

$\Rightarrow l$  bisects AC.

**Example 6 :** In  $\triangle ABC$ , D, E and F are respectively the mid-points of sides AB, BC and CA (see Fig. 8.18). Show that  $\triangle ABC$  is divided into four congruent triangles by joining D, E and F.

Solution: We know that the line segment joining the mid-points of two sides of a triangle is parallel to the third side.

$DE \parallel AC$ ,  $DF \parallel BC$  and  $EF \parallel AB$

Therefore ADEF, BDFE and DFCE are all parallelograms.

Now DE is a diagonal of the parallelogram BDFE,

Therefore,  $\triangle BDE \cong \triangle FED$

Similarly  $\triangle DAF \cong \triangle FED$  and  $\triangle EFC \cong \triangle FED$

So, all the four triangles are congruent

**Example 7 :**  $l, m$  and  $n$  are three parallel lines intersected by transversals  $p$  and  $q$  such that  $l, m$  and  $n$  cut off equal intercepts  $AB$  and  $BC$  on  $p$  (see Fig. 8.19). Show that  $l, m$  and  $n$  cut off equal intercepts  $DE$  and  $EF$  on  $q$  also.

Sol: Let us join  $A$  to  $F$  intersecting  $m$  at  $G$ .

The trapezium  $ACFD$  is divided into two triangles; namely  $\triangle ACF$  and  $\triangle AFD$ .

In  $\triangle ACF$ , it is given that  $B$  is the mid-point of  $AC$  ( $AB = BC$ )

and  $BG \parallel CF$  (since  $m \parallel n$ ).

So,  $G$  is the mid-point of  $AF$ .

Now, in  $\triangle AFD$ , we can apply the same argument as  $G$  is the mid-point of  $AF$ ,  $GE \parallel AD$ , so  $E$  is the mid-point of  $DF$ ,

i.e.,  $DE = EF$

$\Rightarrow l, m$  and  $n$  cut off equal intercepts on  $q$  also.

### EXERCISE 8.2

1.  $ABCD$  is a quadrilateral in which  $P, Q, R$  and  $S$  are mid-points of the sides  $AB, BC, CD$  and  $DA$ .  $AC$  is a diagonal. Show that :

(i)  $SR \parallel AC$  and  $SR = \frac{1}{2} AC$

(ii)  $PQ = SR$

(iii)  $PQRS$  is a parallelogram.

Sol: We know that the line segment joining the mid-points of two sides of a triangle is parallel to the third side and also half of it.

(i) In  $\triangle ABC$ ,  $P$  and  $Q$  are midpoints of  $AB$  and  $BC$ .

$PQ \parallel AC$  and  $PQ = \frac{1}{2} AC \rightarrow (1)$

(ii) In  $\triangle ADC$ ,  $S$  and  $R$  are midpoints of  $DA$  and  $DC$ .

$SR \parallel AC$  and  $SR = \frac{1}{2} AC \rightarrow (2)$

From (1) and (2)

$PQ = SR$

(iii) From (1) and (2)

$SR \parallel AC$  and  $PQ \parallel AC$

$\Rightarrow PQ \parallel SR$  also  $PQ = SR$

$\therefore PQRS$  is a parallelogram.

2.  $ABCD$  is a rhombus and  $P, Q, R$  and  $S$  are the mid-points of the sides  $AB, BC, CD$  and  $DA$  respectively. Show that the quadrilateral  $PQRS$  is a rectangle.

Sol: We know that the line segment joining the mid-points of two sides of a triangle is parallel to the third side and also half of it.

In  $\triangle ABC$ , P and Q are midpoints of AB and BC.

$$PQ \parallel AC \text{ and } PQ = \frac{1}{2} AC \rightarrow (1)$$

In  $\triangle ADC$ , S and R are midpoints of AD and DC.

$$SR \parallel AC \text{ and } SR = \frac{1}{2} AC \rightarrow (2)$$

From (1) and (2) :  $PQ \parallel SR$  and  $PQ = SR$

Similarly :  $PS \parallel QR$  and  $PS = QR$

$\therefore$  PQRS is a parallelogram.

$MO \parallel PN$  and  $PM \parallel NO$

PMON also a parallelogram.

$\angle MPN = \angle MON$  ( opposite angles in a parallelogram)

But  $\angle MON = 90^\circ$  (Diagonals of a rhombus perpendicular to each other)

$\therefore \angle MPN = 90^\circ$

In parallelogram PQRS one angle is  $90^\circ$

So, PQRS is a rectangle.

3. ABCD is a rectangle and P, Q, R and S are mid-points of the sides AB, BC, CD and DA respectively. Show that the quadrilateral PQRS is a rhombus.

Sol: We know that the line segment joining the mid-points of two sides of a triangle is parallel to the third side and also half of it.

In  $\triangle ABC$ , P and Q are midpoints of AB and BC.

$$PQ \parallel AC \text{ and } PQ = \frac{1}{2} AC \rightarrow (1)$$

In  $\triangle ADC$ , S and R are midpoints of AD and DC.

$$SR \parallel AC \text{ and } SR = \frac{1}{2} AC \rightarrow (2)$$

From (1) and (2) :  $PQ \parallel SR$  and  $PQ = SR = \frac{1}{2} AC$

Similarly :  $PS \parallel QR$  and  $PS = QR = \frac{1}{2} BD$

Also,  $AC = BD$  (Diagonals of a rectangle  $AC, BD$  are equal)

$$\therefore PQ = QR = RS = SP$$

So, PQRS is a rhombus.

4. ABCD is a trapezium in which  $AB \parallel DC$ , BD is a diagonal and E is the mid-point of AD. A line is drawn through E parallel to AB intersecting BC at F (see Fig. 8.21). Show that F is the mid-point of BC.

Sol: We know that the line drawn through the mid-point of one side of a triangle, parallel to another side bisects the third side.

In  $\triangle ABD$ ,  $EO \parallel AB$  and E is mid point of AD

$\Rightarrow O$  is mid point of BD

In  $\triangle CBD$ ,  $OF \parallel CD$  and O is mid point of BD

$\Rightarrow F$  is mid point of BC

5. In a parallelogram ABCD, E and F are the mid-points of sides AB and CD respectively (see Fig. 8.22). Show that the line segments AF and EC trisect the diagonal BD.

Sol: E and F are the mid-points of sides AB and CD

$$DF = FC = \frac{1}{2}DC \text{ and } AE = EB = \frac{1}{2}AB$$

$AB \parallel DC$  and  $AB = CD$  (ABCD is a parallelogram)

$$\Rightarrow AE \parallel FC \text{ and } \frac{1}{2}AB = \frac{1}{2}CD$$

$$\Rightarrow AE \parallel FC \text{ and } AE = FC$$

$\therefore AEFC$  is a parallelogram.

$$\Rightarrow AF \parallel EC$$

In  $\triangle ABP$ ,  $EQ \parallel AP$  and E is midpoint of AB.

$\Rightarrow Q$  is midpoint of BP

$$\Rightarrow BQ = QP \rightarrow (1)$$

In  $\triangle DQC$ ,  $FP \parallel CQ$  and F is midpoint of DC.

$\Rightarrow P$  is midpoint of DQ

$$\Rightarrow QP = PD \rightarrow (2)$$

From (1) and (2)

$$BQ = QP = PD$$

∴ The line segments AF and EC trisect the diagonal BD.

6. ABC is a triangle right angled at C. A line through the mid-point M of hypotenuse AB and parallel to BC intersects AC at D. Show that (i) D is the mid-point of AC (ii)  $MD \perp AC$

$$(iii) CM = MA = \frac{1}{2} AB$$

Sol: We know that the line drawn through the mid-point of one side of a triangle, parallel to another side bisects the third side.

(i) In  $\triangle ABC$ ,  $MD \parallel BC$  and M is midpoint of AB

⇒ D is midpoint of AC.

(ii)  $MD \parallel BC$  and AC is transversal

$$\begin{aligned} \angle MDC + \angle BCD &= 180^\circ \text{ (Co} \\ &\text{— interior angles are supplementary)} \end{aligned}$$

$$\angle MDC + 90^\circ = 180^\circ$$

$$\angle MDC = 180^\circ - 90^\circ = 90^\circ$$

∴  $MD \perp AC$

(iii) In  $\triangle AMD$  and  $\triangle CMD$

$AD = DC$  (D is midpoint of AC)

$$\angle ADM = \angle CDM (= 90^\circ)$$

$MD = MD$  (Common)

$\triangle AMD \cong \triangle CMD$  (SAS congruence rule)

$AM = CM$  (By CPCT)

But  $AM = \frac{1}{2} AB$  (M is mid point of AB)

$$\therefore CM = MA = \frac{1}{2} AB$$
